Granola Scenario Cards — Facilitator Answer Key

"Does It Fit Here?" activity — quick reference for guiding the debrief discussion.

FOR YOUR EYES ONLY — DO NOT HAND OUT TO PLAYERS

Good fit	**Breakfast before school**	Quick and easy — pair with milk or yogurt for extra protein to start the day.
Good fit, with care	**Afternoon snack, ~2h before training**	Fine as a snack, but keep the portion controlled — the fat content digests slowly, so a big handful right before training isn't ideal.
Not ideal as main recovery	**Right after a match**	The fat slows digestion when the body wants fast carbs + protein — lean on the post-workout snack first, with granola after if still hungry.
Not the best choice	**Late at night, before bed**	Energy-dense and slow to digest — a small amount is fine, but it's not the ideal bedtime snack.
Good fit	**Long bus trip to an away game**	Portable, no fridge needed, easy to self-portion — one of its best use cases.
Situational	**Between two sessions, same day**	Works better paired with something faster-digesting (fruit) alongside it, rather than as the only recovery food between sessions.

WRAP-UP LINE FOR THE GROUP

"Granola isn't good or bad — it's about matching the ingredient to the moment. Same food, different answer depending on when you eat it and how much." This connects directly back to the pre-workout framing from the overnight oats session.
